

COMP110: Principles of Computing

## **12: Further Computational Mathematics for Games**

# Worksheet E

- ▶ Assembly programming (TIS-100)
- ▶ Due **week 13** (after Christmas — see timetable)

# Quiz E

- ▶ There is no Quiz E
- ▶ But complete quizzes A–D if you haven't already!

# Final worksheet submission

- ▶ Check MyFalmouth for the deadline
- ▶ **Download all five** of your worksheet forks as zips
- ▶ **Extract** them into five separate folders
- ▶ **Re-compress** the five folders into a **single zip file**
- ▶ **Upload** this zip file to LearningSpace

# **Recursion and induction**

# A formula for summation

$$\sum_{i=1}^n i = \frac{1}{2}n(n+1)$$

- ▶  $n = 1$ :  $1 = \frac{1}{2} \times 1 \times 2$
- ▶  $n = 2$ :  $1 + 2 = \frac{1}{2} \times 2 \times 3 = 3$
- ▶  $n = 3$ :  $1 + 2 + 3 = \frac{1}{2} \times 3 \times 4 = 6$
- ▶ ...

# Proving the formula

- ▶ We can verify the formula for individual values of  $n$
- ▶ How do we **prove** it for **all**  $n$ ?
- ▶ We can use **proof by induction**

# Proving the formula

## Base case

►  $n = 1: 1 = \frac{1}{2} \times 1 \times 2$

## Inductive assumption

►  $\sum_{i=1}^{k-1} i = \frac{1}{2}(k-1)k$

## Therefore

►  $\sum_{i=1}^k i = \left(\sum_{i=1}^{k-1} i\right) + k$

►  $= \frac{1}{2}(k-1)k + k$  (by inductive assumption)

►  $= \frac{1}{2}k^2 - \frac{1}{2}k + k$

►  $= \frac{1}{2}k^2 + \frac{1}{2}k$

►  $= \frac{1}{2}k(k+1)$

So **if** the formula works for  $n = k - 1$ , **then** it works for  $n = k$

# Completing the proof

- ▶ We know:
  - ▶ The formula works for  $n = 1$
  - ▶ If the formula works for  $n = k - 1$ , then it works for  $n = k$
- ▶ The formula works for  $n = 1$
- ▶ Therefore the formula works for  $n = 1 + 1 = 2$
- ▶ Therefore the formula works for  $n = 2 + 1 = 3$
- ▶ Therefore the formula works for  $n = 3 + 1 = 4$
- ▶ ...
- ▶ Therefore the formula works for all positive integers  $n$

# Exercise

Prove

$$\sum_{i=1}^n i^2 = \frac{n(n+1)(2n+1)}{6}$$

# Thinking inductively

- ▶ I want to prove something for all  $n$
- ▶ Given  $k$ , if I had already proved  $n = k - 1$  then I could prove  $n = k$
- ▶ I can also prove  $n = 1$
- ▶ Therefore by induction I can prove the result for all  $n$

# Thinking recursively

- ▶ I want to solve a problem
- ▶ If I already had a function to solve smaller instances of the problem, I could use it to write my function
- ▶ I can solve the smallest possible problem
- ▶ Therefore I can write a recursive function

# Exercise

- ▶ **Write** a pseudocode function to calculate the total size of all files in a directory and its subdirectories
- ▶ You may use the following functions in your pseudocode:
  - ▶ LISTDIR(directory): return a list of names of all files and folders in the given directory
  - ▶ GETSIZE(filename): return the size, in bytes, of the given file
  - ▶ ISDIR(name), ISFILE(name): determine whether the given name refers to a file or a directory

**procedure** CALCDIRSIZE(directory)

...

▷ return total size in bytes

**end procedure**
