COMP120: Creative Computing: Tinkering

## 5: Tinkering Graphics II

#### Learning Outcomes

- Explain how conditional logic can manipulate the output of a computer program
- Apply mathematical knowledge to write computer programs that manipulate pixels in a surface
- Trace existing computer programs to predict its output for a given input

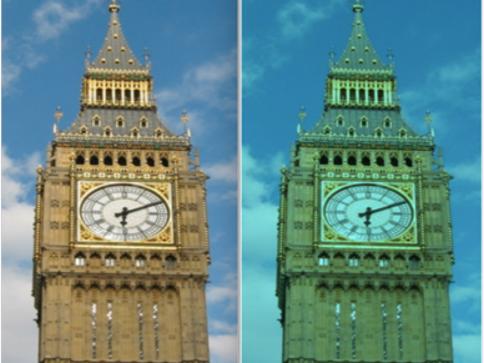

## **Code Tracing**

#### Demo

- ► Start using debug tools when you run into problems:
- ► https://www.youtube.com/watch?v=QJtWxm12Eo0

#### Source Code: Less Red

```
def decreaseRed(picture, amount):
   pixelMatrix = getPixels(picture)
   for pixel in pixelMatrix:
     value = getRed(pixel)
     setRedPixel(pixel, value * amount)
```

#### Activity: Less Red

If 'bb' is the original picture of Big Ben, which of the below function calls created the change:

- changeRed(bb, 1.5)
- ► changeRed(bb, 2.0)
- changeRed(bb, 0)

**Tinkering Graphics Activities** 

## Calculating Distance Between Colors

Sometimes we need to measure when something is 'close enough':

- Distance between two points in the Cartesian coordinate system:
- $\blacktriangleright \sqrt{(x_1-x_2)^2+(y_1-y_2)^2}$
- Distance between two colours in the RGB colour representation system:

$$\sqrt{(red_1 - red_2)^2 + (green_1 - green_2)^2 + (blue_1 - blue_2)^2}$$

#### Activity: Color Distance

- Setup a basic project in PyGame
- Use the distance equation from the previous slide to write a function which accepts a two colours and returns the distance
- ► Test your solution
- Then, post your solution on Slack
- ▶ 10 minutes

#### Output: Color Distance

```
>>> print distance(WHITE, BLACK)
441.6729559300637
>>> print distance(WHITE, PINK)
113.13708498984761
>>> print distance(BLACK, PINK)
355.3519382246282
>>> print distance(MAGENTA, PINK)
192.41881404893857
```

# Source Code: Conditions and Return Values

```
def closeEnoughToBrown(colour):
    if distance(colour, BROWN) < 50.0:
        return True
    else:
        return False</pre>
```

#### Source Code: Conditional Tolerance

```
def turnRed():
  brown = makeColor(42, 25, 15)
  file="/Users/quzdial/Desktop/mediasources/katieFancy ←
      .jpq"
  picture=loadPicture (file)
  for pixel in getPixels(picture):
    color = getColor(pixel)
    if distance(color, BROWN) < 50.0:</pre>
      red=getRed(pixel) *2
      green=getGreen(pixel)
      blue=getBlue(pixel)
      setColor(pixel, makeColor(red, green, blue))
  return picture
```

### Activity: Colour Tolerance

- Setup a basic project in PyGame
- ► Implement the function closeEnough((colour, colour), tolerance) that returns a boolean value
- Test your solution
- ► Then, post your solution on Slack
- ▶ 10 minutes

#### Red Eye

- When the flash of the camera catches the eye just right (especially with light colored eyes), we get bounce back from the back of the retina.
- ► This results in 'red eye'
- We can replace the red with a color of our choosing
- First, we figure out where the eyes are (x,y)

## Activity: Red Eye

- Setup a basic project in PyGame
- Refer to the following documentation
  - http://www.pygame.org/docs/ref/rect.html
- ► Implement the function: removeRedEye (picture, area, colour)
- ► Test your solution
- ► Then, post your solution on Slack
- 20 minutes

## Calculating Luminance in RGB

- ► Luminance is the overall brightness of a pixel
- ► In RGB, it is the *mean* average value of each component:
  - ► lum = (red + green + blue)/3

#### **Posterization**

- Posterization is simply reducing the number of colours in an image
- We look for a range of colours, then map them to a single colour:
  - If red is between 63 and 128, set it to 95
  - If green is less than 64, set it to 31
- The end result is that a bunch of different colours, get set to a few colours
- Beware of naive solutions with a large number of 'if' statements

#### Source Code: Black and White

```
def blackAndWhitePosterize(picture):
    for pixel in getPixels(picture):
        red = getRed(pixel)
        green = getGreen(pixel)
        blue = getBlue(pixel)
        luminance = (red + green + blue) / 3
        if luminance < 64:
            setColor(pixel, BLACK)
        else:
            setColor(pixel, WHITE)</pre>
```

#### Activity: Posterization

- Setup a basic project in PyGame
- Refer to the following documentation
- ► Implement the function: makeGreyscale (picture, colourCount)
- ► Test your solution
- ▶ Then, post your solution on Slack
- ▶ 20 minutes

#### Sepia Tone

- ▶ Pictures that are sepia-toned have a yellowish tint to them that we associate with older pictures.
- It's not directly a matter of simply increasing the yellow in the picture, because it's not a one-to-one correspondence:
  - Instead, colors in different ranges get mapped to other colours.
  - We can create such a mapping using IF statements
- The end result is that a bunch of different colours, get set to a few colours
- Beware of naive solutions with a large number of 'if' statements

#### Source Code: Sepia (1)

```
def sepiaTint(picture):
  #Convert image to greyscale
  makeGreyscale (picture)
  #loop through picture to tint pixels
  for p in getPixels(picture):
    red = getRed(p)
    blue = getBlue(p)
    #tint shadows
    if (red < 63):
      red = red * 1.1
      blue = blue * 0.9
```

### Source Code: Sepia (2)

```
#t.int midt.ones
 if (red > 62 and red < 192):
   red = red*1.15
  blue = blue * 0.85
 #tint highlights
 if (red > 191):
   red = red*1.08
   if (red > 255):
    red = 255
   blue = blue * 0.93
 #set the new color values
 setBlue(p, blue)
 setRed(p, red)
```

#### Sepia Tone

- First, we're calling greyScaleNew (the one with weights).
- We then manipulate the red (increasing) and the blue (decreasing) channels to bring out more yellows and oranges.
  - It's perfectly okay to have one function calling another.
  - Why are we doing the comparisons on the red? Why not? After greyscale conversion, all channels are the same!
- The end result is that a bunch of different colours, get set to a few colours
- ▶ Why these values? Trial-and-error: Tinker the values!

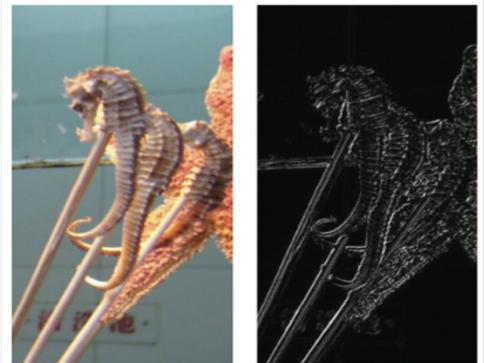

#### Activity: Sepia Tone

- Setup a basic project in PyGame
- Refer to the following documentation
- ► Refactor the function: sepiaTint (picture) to use constants rather than literals
- Tinker with the values of the constants to test your solution
- Then, post your solution on Slack
- 20 minutes

#### **Edge Detection**

- Blurring is averaging across pixels
- Edge detection is looking for differences between pixels:
  - We draw lines that our eyes see where the luminance changes
- ► If the pixel changes left-to-right, or up-and-down, make a pixel black. Else, white.

## Source Code: Edge Detection

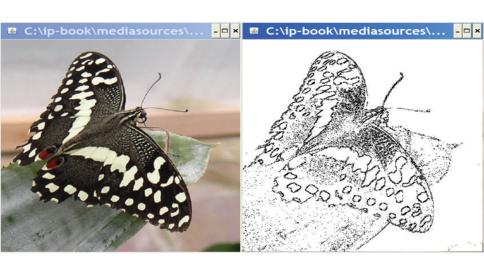

## Source Code: Edge Detection (1)

```
def drawBetterEdges(picture):
  orig = makePicture(filename)
  makeBw = makePicture(filename)
  for x in xrange(0, getWidth(picture)-1):
    for y in xrange(0, getHeight(picture)-1):
      here=getPixel(makeBw,x,y)
      down=getPixel(orig,x,y+1)
      right=getPixel(orig,x+1,y)
      hereL=(getRed(here)+getGreen(here)+getBlue(here)
          )/3
      downL=(getRed(down)+getGreen(down)+getBlue(down) ←
          )/3
      rightL=(getRed(right)+getGreen(right)+getBlue( ←
          right))/3
```

## Source Code: Edge Detection (2)

```
if abs(hereL-downL)>10 and abs(hereL-rightL)>10:
    setColor(here,black)
    if abs(hereL-downL)<=10 and abs(hereL-rightL) 
        <=10:
        setColor(here,white)
    return makeBw</pre>
```

### Activity: Edge Detection

- Setup a basic project in PyGame
- Refer to the following documentation
- Refactor the function: drawBetterEdges (picture) to use better variable names
- ► Test your solution
- ▶ Then, post your solution on Slack
- ▶ 15 minutes

#### Background Subtraction

- Let's say that you have a picture of someone, and a picture of the same place (same background) without the someone there, could you subtract out the background and leave the picture of the person?
- Maybe even change the background?
- What we most need to do is to figure out whether the pixel in the Person shot is the same as the in the Background shot.
- ▶ Will they be the EXACT same colour? Probably not.

# Source Code: Background Subtraction

```
def swapBackground(picture, back, newBack, tolerance):
   for pixel in getPixels(picture):
        x = getX(pixel)
        y = getY(pixel)
        backPixel = getPixel(back, x, y)
        pixelColour = getColour(pixel)
        backColour = getColour(backPixel)
        if (distance(pixelColour, backColour) < tolerance):
            newColour = getColour(getPixel(newBack, x, y))
            setColor(pixel, newColour)</pre>
```

#### **Problems**

- We've got places where we got pixels swapped that we didn't want to swap
- We've got places where we want pixels swapped, but didn't get them swapped
  - Shirt stripes
  - Shadows
  - etc.

## Activity: Background Subtraction

- Setup a basic project in PyGame
- Refer to the following documentation:
  - http://www.cs.utah.edu/~michael/chroma/
- Implement chroma key as a form of background subtraction
- ► Test your solution
- ► Then, post your solution on Slack
- ▶ 30 minutes
