

COMP120: Creative Computing: Tinkering

1: Python, Pairs, & PyGame

Learning Outcomes

- ► **Explain** the role and basic functions of the IDE
- Interpret some basic Python code
- Apply pair programming practices to solve a simple problem

Integrated Development (Environment (IDE)

Using an IDE

- You could just write code in Notepad, but...
- An Integrated Development Environment (IDE) is an application providing several useful features for programmers, including:
 - ▶ A "run" button
 - Management of multi-file projects
 - Syntax highlighting
 - Autocompletion
 - Navigation
 - Language and API documentation
 - Debugging
 - ▶ Profiling
 - Version control

Setting up your own PC

- ► Python 3.7
 - ▶ https://www.python.org/
 - Python 2.x and Python 3.x are (slightly) different programming languages; we are using 3.x (for now)
 - Python is included with Mac OSX and most Linux distributions, but needs to be installed separately on Windows
- ▶ PyGame 1.9.4
 - We use PyGame as our framework for media computation and game development
 - Library version must accord with language version
 - Insteall on your PC using pip

pip install pygame==1.9.4

Setting up your own PC

- ▶ PyCharm 2018.2
 - ▶ https://www.jetbrains.com/student/
 - Register with your falmouth.ac.uk email address to obtain PyCharm Professional Edition for free
 - Or, use the free open-source entitled `Community Edition'
 - Runs on Windows, Mac and Linux

PyCharm in the Lab

- You have to license your account to use PyCharm
- Run PyCharm and select License server
- ► In the License server address enter the following:

```
http://trlicefal.fal.ac.uk
```

 This will be added to your user profile and (hopefully) you will not need to do this again

Getting started with PyCharm

- Create a new project (from the start-up wizard or from the File menu)
- We want a "Pure Python" project
- ▶ Right-click the project in the panel on the left, and choose "New → Python File"
- ► Write some code!
- Setup the run configurations
- First run: click "Run \rightarrow Run..." and choose the Python file
- ► Subsequent runs: click the ► button

Basic Python programs

Your first Python program

```
print("Hello, world!")
```

Your second Python program

```
print("This is a very long line of code which had to ←
   be split to fit on the slide, but you should type ←
   it as a single line.")
print("This is the second line of code.")
```

Assigning to variables

```
a = 10
print(a)
```

Variable	Value
a	

Remember!

- ► A program is a **sequence of instructions**
- The Python interpreter executes the first line of your program, then the second line, and so on
- When it reaches the end of the file, it stops

Reassigning variables (1)

```
a = 10
b = 20
b = a
print(a)
print(b)
```

Variable	Value
a	
b	

Reassigning variables (2)

```
a = 10
b = 20
a = b
print(a)
print(b)
```

Variable	Value
a	
b	

Reassigning variables (3)

```
big = 10
small = 20
big = small
print(big)
print(small)
```

Variable	Value
big	
small	

Reassigning variables (4)

```
a = 10
b = 20
a = b
b = a
print(a)
print(b)
```

Variable	Value
a	
b	

Reassigning variables (5)

```
a = 10
b = 20
c = 30

a = b
b = c

print(a)
print(b)
print(c)
```

Variable	Value
a	
b	
С	

Reading input

- ▶ input () reads a string as text from the command line
- ▶ int(...) converts a string into an integer (a number)

Conditionals (1)

```
a = int(input())
b = 30

if a < 15:
    b = a

print(a)
print(b)</pre>
```

Variable	Value
a	
b	

Indentation

- Unlike many other programming languages, indentation has meaning in Python!
- Python uses indentation to denote the block of code inside a conditional, loop, function etc.
- ▶ PEP-8 recommends 4 spaces for indentation
 - Some programmers use a tab character
 - Never mix tabs and spaces in the same file!
 - PyCharm inserts 4 spaces by default when you press the tab key; other IDEs and text editors can be configured to do this

Conditionals (2)

```
a = int(input())
b = 0
if a < 20:
elif a == 20:
else:
print(a)
print (b)
```

Variable	Value
a	
b	

Conditionals

An if statement can have:

- ▶ Zero or more elif clauses
- ► An optional else clause

In that order!

Mathematical operators

- → + add
- ► subtract
- ▶ * multiply
- ▶ / divide
- ▶ ** power

Order of operations: **BIDMAS**

- ▶ Brackets first
- ► Then indices (powers)
- Then division and multiplication (left to right)
- ► Then addition and subtraction (left to right)

Comparison operators

- < less than</p>
- <= less than or equal to</p>
- > greater than
- >= greater than or equal to
- == equal to
- ▶ != not equal to

Note the difference between = and ==

- ▶ a = b means "make a be equal to b"
- ▶ a == b means "is a equal to b?"

For loops and ranges

```
for i in range(5):
    print(i)
```

- ▶ range (n) is the sequence 0, 1, 2, ..., n-1
- ▶ So range (5) is the sequence 0, 1, 2, 3, 4
- ► Note: range (n) does not include n
- The for loop iterates through the items in a sequence in order

For loops (1)

```
a = 0
b = 0

for i in range(5):
    a = i
    b = b + i

print(a)
print(b)
```

Variable	Value
a	
b	
i	

For loops (2)

Variable	Value
a	
b	
i	

While loops

The while loop keeps executing while the condition is true

```
a = 1
while a < 100:
    a = a * 2
print(a)</pre>
```

Variable	Value
a	

Looping forever

```
a = 1
while True:
    a = a * 2
    print(a)
```

Summary

We have seen some basic code constructions in Python

- print() and input() for command-line input and output
- Variable assignment using =
- if statements for choosing whether or not to execute a block of code
- for loops to execute a block of code a specified number of times
- while loops to execute a block of code until a condition is no longer true

These are enough to write some simple programs, but you will see several more in coming weeks...

PASS Challenge

- In pairs
- Implement the code excerpt
- Fix the errors in the code excerpt
- Modify the code excerpt to incorporate functions and arguments
- ▶ Post your solution to the #comp120 slack channel

You can learn more about functions and arguments at:

```
https://docs.python.org/3/tutorial/controlflow.html#defining-functions
```

(20 minutes)

PASS Challenge

The function:

```
def madlib()
```

Should become:

```
def madlib(name, pet, verb, snack)
```

PASS Challenge

```
def madlib():
    name = 'Link'
    line2 = ' with ' + pet + ', a trained dragon.'
    line5 = name + ' complained. Where am I going to \leftrightarrow
    line6 = 'Then ' + name + 'found a wizard's wand.'
    line 7 = 'With a wave of the wand, '
    line9 = 'Perhaps surprisingly, ' + pet + ' ' +
```

PASS Challenge Stretch Goal

- ▶ In pairs
- Incorporate your code into the PyGame framework
- ▶ Post your solution to the #comp120 slack channel
- You will likely need to search the PyGame library documentation and StackOverflow:

www.pygame.org/docs/ref/pygame.html
stackoverflow.com/questions/tagged/pygame

PASS Challenge Stretch Goal

```
import pygame
pygame.init()
screen = pygame.display.set_mode((640, 480))
done = False
while not done:
    for event in pygame.event.get():
        if event.type == pygame.QUIT:
            done = True
        if event.type == pygame.KEYDOWN and event.key \leftarrow
            == pygame.K_ESCAPE:
    screen.fill((255, 255, 255))
    pygame.display.flip()
```
